

Environment Setup for Hosted LLMs

- **Can We Use LLMs Without Installing Them Locally?**
- Yes. With the help of Hosted LLMs, we can use powerful AI models without installing or managing them on our own computers or servers.
- We simply access them over the internet using REST APIs.

- **What are Hosted LLMs?**
- Hosted LLMs are Large Language Models that are hosted and managed by AI providers or cloud AI platforms.
- Instead of running the models on our own computers or servers, we access them over the internet using REST APIs.

- **When Should We Use Hosted LLMs?**
- Choose Hosted LLMs when you want to focus on building AI applications rather than managing servers, GPUs, storage, and LLM deployments.
- Note: If your organization has strict data privacy or compliance requirements, Local LLMs may be a better choice.
- Hosted LLMs are offered by various AI providers and Cloud AI Platforms.

AI Providers:

- ✓ OpenAI
- ✓ Google Gemini
- ✓ Anthropic
- ✓ Groq
- ✓ Cohere
- ✓ Mistral AI

Cloud AI Platforms:

- ✓ AWS
- ✓ OCI
- ✓ Azure
- ✓ Google

Environment Setup for Hosted LLMs: Accessing Hosted LLMs

- To use Hosted LLMs in our AI applications, we typically need:
 - ✓ Create an account with the AI provider or cloud AI platform.
 - ✓ Generate an API Key or obtain the required access credentials.
 - ✓ Call the Hosted LLM through its REST API from our AI application using API Keys or Access Credentials.
- **Notes:**
 - ✓ AI Providers typically use API Keys to access Hosted LLMs.
 - ✓ Cloud AI Platforms typically use cloud-specific access credentials (such as IAM credentials or access keys) to authenticate and access Hosted LLMs.
- Hosted LLMs are generally paid services. However, some AI providers offer free tiers or trial credits for learning, testing, and development.
- In this course, we'll use Groq as our Hosted LLM provider because it offers a free usage tier (subject to current limits)
