

Types of AI Models Based on Usage

- An AI model is like a specialized brain trained to perform a specific type of task.
- A Large Language Model (LLM) is one type of AI model that is designed to understand and generate text.
- Similarly, there are AI models for image generation, speech recognition, text-to-speech, vision, and embeddings.

★ Note: This course focuses on LLMs (Text Models) for building AI applications. The concepts you learn here can be applied to other AI models, since most of them follow similar development workflows and API patterns.

- Different organizations - OpenAI, Google, Anthropic, Meta, and DeepSeek all provide their own AI models
