

Types of AI Developers

- We already know that AI Models are like specialized brains that provide intelligence to AI applications.
- Based on how developers work with AI models, AI Developers are classified into two categories:
- They are:
 - AI Model Developers: who build and improve AI Models
 - AI Application Developers: who use AI Models to build AI-powered applications.

1 AI Model Developers:

- Design, build, and train AI models.
- Improve model accuracy, reasoning, and performance.
- Develop specialized AI models such as LLMs, Image Models, Speech Models, and Embedding Models.

2 AI Application Developers

- Build AI-powered applications using existing AI models.
- Integrate AI models into applications through APIs or SDKs.
- Focus on solving business problems using AI Models rather than training AI models.

What job roles can I apply for after learning AI Application Development?

- **LLM Application Developer** – Builds applications powered by Large Language Models.
- **RAG Engineer (Retrieval-Augmented Generation)** – Builds AI applications that combine LLMs with external knowledge sources.
- **AI Engineer** – Builds end-to-end AI-powered applications.
- **Generative AI Engineer** – Develops applications using LLMs and other generative AI models.
- **AI Agent Developer** – Develops autonomous AI agents using frameworks like LangGraph, CrewAI, or similar tools.
- **AI Integration Engineer** – Integrates AI capabilities into existing enterprise applications and business systems.
- **Prompt Engineer** – Designs and optimizes prompts and AI workflows for better model performance.

Can we Build Our Own AI Models ?

- Yes, absolutely! However, building custom AI Models requires massive infrastructure:

Vast Datasets

Requires filtering, cleaning, and curating trillions of text tokens from web-scale data sources.

GPU Computing Power

Demands thousands of high-performance enterprise GPUs working in distributed parallel clusters.

Capital & Time

Requires millions of dollars in infrastructure investment and months of continuous computing power.

- **Key Takeaway**
 - AI Model Developers create the brains/AI Models. AI Application Developers use those brains/AI Models to build intelligent applications.
 - This course focuses on becoming an AI Application Developer using AI models, primarily Large Language Models (LLMs).
